EdgeORE — Pitch Package (retrospective + dApp Store launch)

> **Framing.** Solana Mobile hackathon submissions closed **8 Oct 2026**; this package is dated **12 Oct 2026**. It is a retrospective plus a Solana dApp Store launch package, **not** a live submission. Every claim carries one label: **QUALIFIED** (re-run with evidence in this repo) · **IMPLEMENTED_UNVERIFIED** (in source, evidence only from a dev machine or JVM) · **DESIGN** (written down, not built) · **BLOCKED** · **NOT_RUN**. Evidence base: commit `84a788cbd926` on `feature/ore-grid-readonly`, gate folder `evidence/build-84a788cbd926/`.

1. One-liner

Every wallet action on Seeker produces a signed receipt you can verify offline — including the ones you refuse.

2. Problem — five Seeker-user pain points

1. You tap Approve in a wallet popup and never see the exact bytes you signed.
2. After a timeout you don't know whether the transaction sent, failed or is still pending — and the app may resend.
3. There is no artifact on your phone that answers "what did I sign, and when".
4. Two apps give you two different stories about the same transaction.
5. "Success" is a UI label, not a proof you can hand to anyone.

3. Solution — the trust spine

One invariant across every action: **a receipt you own.**

```
Review bytes → Approve exact message → Sign in wallet → Verify returned bytes → Submit separately → Export receipt
```

If the wallet returns different bytes, the app refuses. If the network is unreachable after signing, the app observes — it does not auto-resend. Unknown outcomes stay unknown until observation resolves them. The standalone JVM checker **verifies the integrity of signed receipt contents**; it does not prove that a transaction happened on-chain.

Status: wallet journey (devnet SOL transfer) **IMPLEMENTED_UNVERIFIED**; end-to-end run with a real wallet **NOT_RUN**.

4. Product tour

Screen	What the user does	What they see	Status
Mine	Taps **Start Mining** to run a contribution session: Groth16 proof jobs on a paired node + 256 KiB vault-sealed chunk round trips through the owned gateway	Phase (IDLE → STARTING → ACTIVE → STOPPING), measured numbers, receipts; pickaxe animates only while ACTIVE	IMPLEMENTED_UNVERIFIED (dev-machine e2e: 5 proof jobs + 5 round trips verified, receipt checker ok=6)
ORE board (from Mine)	Opens a read-only view of the live ORE v3 board	5×5 grid, round, per-square SOL, motherlode, text-only advisor	IMPLEMENTED_UNVERIFIED (JVM tests + mainnet read captures; no device run)
Private AI	Configures an owned-host model endpoint or downloads an allowlisted on-device model	Endpoint policy, checksum-pinned allowlist	IMPLEMENTED_UNVERIFIED
Storage	Encrypts a 256 KiB chunk through the owned gateway	Round trip, byte-identical verify	IMPLEMENTED_UNVERIFIED (dev machine)
Nodes	Pairs a pinned node-agent revision	Scoped pairing, health read, log read, revoke	IMPLEMENTED_UNVERIFIED

Screen	What the user does	What they see	Status
Receipts	Exports a signed record	JSON envelope, sha256, signature	QUALIFIED at JVM checker level (14 tests); IMPLEMENTED_UNVERIFIED on device

Nothing in any screen earns anything: no ORE, SKR, points or payment.

5. SKR

Mechanic	Role of SKR	Status
Burn-to-mine (epoch pool)	SKR committed to a pool → points	DESIGN
Pro-Mine stake	Stake SKR → multiplier	DESIGN
Daily chests	SKR paid for refreshes	DESIGN
Weekly / monthly draws	SKR as qualifier	DESIGN — paid-chance mechanics would need odds disclosure, geofencing and legal review before any build
Epoch airdrop pool	Reward at epoch close	DESIGN — no pool size set, nothing allocated, nothing on-chain

Live right now: nothing. The app does **not** read SKR mint state; the only SKR references in `app/src/main` are disclaimers ("no ORE, SKR, points or payment").

6. ORE

Mechanic	Role of ORE	Status
ORE v3 board read	Reads Board + Round accounts (25 squares, per-square SOL, motherlode) over public mainnet RPC	IMPLEMENTED_UNVERIFIED (JVM fixtures from real mainnet captures; no device run)
Advisor	Explains the snapshot in plain text, quoting only snapshot values; not financial advice	IMPLEMENTED_UNVERIFIED
Deploy / checkpoint / claim	—	Not built by choice. The app cannot build or sign any ORE instruction.
ORE rewards for contribution	—	Not offered. No integration with the ORE program beyond reading accounts.

Layouts and program id come from regolith-labs/ore at `48c203bd75db3cc45105ec29d8f8db719e5a2263` (see `docs/ore/README.md`). EdgeORE is not affiliated with Regolith Labs.

7. Evidence (84a788cbd926) — counts listed separately, never summed

Suite	Result	Source
Android JVM unit tests	330 tests: 325 passed, 0 failed, 5 skipped (42 suites)	`summary.md`, `junit/`
Android lint (debug)	No issues	`lint-debug.txt`
Receipt checker (JVM)	14 passed	`separate-gates/receipt-checker.log`
Storage gateway (Python)	17 passed	`separate-gates/gateway-tests.log`

Suite	Result	Source
Extension kit	22 passed	`separate-gates/kit-tests.log`
Build-policy script tests	12 passed	`separate-gates/policy-tests.log`
Release-manifest checker tests	9 passed	`separate-gates/check-manifest-tests.log`
Release manifest check	PASS	`release-manifest.log`
Build policy	PASS	`separate-gates/policy.log`
Contribution session e2e (dev machine)	1 test passed; 5 proof jobs + 5 gateway round trips verified; checker accepted 6 receipts	`session-e2e/`
Screenshot suite	verifyRoborazziDebug exit 0	`screens-verify.log`
Debug APK	`0.2.9-review` / versionCode 11, sha256 `9a101821892e5946c9aac32f68988ebd2ecb050fe6c5eb500db5feb1156f5222`, debug-signed	`summary.md`
Physical Seeker, wallet run, devnet transfer, demo video	NOT_RUN	—

Platform facts (from source): `minSdk 26`, `targetSdk 35`. No Google Play Services, Firebase, analytics, crash-reporting or tracking SDKs in the dependency list. The app **does** request `CAMERA` (optional feature) for QR address scanning, driven by platform Camera2 + ZXing core — no camera SDK. Wallet keys stay in the wallet app via Mobile Wallet Adapter; there is **no direct Seed Vault integration**.

8. Roadmap

Milestone	Content	Status
Now	Device gates on a Seeker: wallet journey, devnet transfer, session, receipts, video	NOT_RUN
Hardening	Detekt, ktlint, MobSF, release signing, bundletool, dApp Store listing (backlog)	DESIGN
v0.3	SKR mechanics only after legal review, on devnet	DESIGN
Later	BLE / mesh / WebRTC / libp2p transports	DESIGN (deferred)

9. 90-second demo script

Time	Shot
0–10 s	One-liner over the Mine screen idle state
10–30 s	Start Mining → ACTIVE, measured numbers tick, pickaxe swings; Stop
30–45 s	Receipts → export; run the JVM checker on a laptop: accepted
45–60 s	Edit one byte of the export → checker rejects

Time	Shot
60–75 s	Review a devnet transfer: exact bytes, sign in wallet, submit separately
75–90 s	ORE board read-only + advisor note; close on "no earnings, no deploy, receipts you own"

Status: script DESIGN; video NOT_RUN.

10. Positioning

Not a wallet, not a miner, not a game. EdgeORE is a **receipt layer** for a Seeker owner's own actions and infrastructure. Generic fit: consumer mobile security, DePIN tooling on owned hardware, Solana Mobile dApp Store utility. (No specific hackathon tracks are claimed: none are documented in this repo.)

11. Q&A

- **Does it earn ORE or SKR?** No. No mining income, rewards or token of any kind.
- **Is it production-ready?** No. Debug-signed review candidate; device gates NOT_RUN.
- **What does the checker prove?** It verifies the integrity of signed receipt contents. It does not prove an on-chain outcome.
- **Seed Vault?** Not integrated directly; signing goes through Mobile Wallet Adapter to the user's wallet.
- **Mainnet?** Transactions are devnet only. Mainnet is used only for read-only ORE account reads.
- **Why a camera permission?** QR address entry; optional feature.

12. dApp Store pre-submit checklist

- [ ] Release build signed with the owner's key (not in repo) — BLOCKED on key
- [ ] AAB/APK validated with bundletool — NOT_RUN
- [ ] MobSF static scan clean — NOT_RUN
- [ ] Detekt + ktlint in CI — DESIGN
- [ ] Physical Seeker walkthrough + video — NOT_RUN
- [ ] dApp Store publisher NFT/listing, privacy policy, store assets — NOT_RUN
- [ ] LICENSE file — **missing** (repo has NOTICE only); owner to choose
- [x] Release manifest check PASS · lint clean · receipt checker 14/14

13. Credits and attribution

Built by CodesbyFebin. Upstream: regolith-labs/ore (account layouts), Solana Mobile Wallet Adapter, Google AI Edge Gallery / LiteRT-LM, ZXing — see `NOTICE`.
