EdgeORE: pitch (CLOCK IN, 12 Oct 2026)

One-liner

EdgeORE is an Android ORE client for Solana Seeker. Every ORE deploy is reviewed, capped, signed in your own wallet, and receipted.

Problem

ORE on mobile means spending real SOL from a phone. Users need to know exactly what they sign, have a hard limit on what one tap can spend, never get a silent retry, and keep a record they can check later.

Product

Step	What EdgeORE does
See the board	Live ORE v3 mainnet board: 5×5 grid, per-square SOL, round, motherlode.
Choose the network	Devnet by default. Mainnet only through an explicit switch plus a risk tick.
Pick an amount	Lite (all 25 squares) or Pro (pick squares). Mainnet is capped at 0.01 SOL per deploy.
Review	The exact message is decoded on screen, with a copper mainnet panel (amount in SOL, round id, squares) and the message SHA-256.
Sign	Mobile Wallet Adapter. The keys stay in your wallet. Returned bytes must match the review.
Submit	One separate tap. The attempt is recorded first. Timeouts stay "unknown". No auto-retry.
Receipt	Android Keystore signed receipt. The JVM checker verifies the integrity of signed receipt contents.
Extras	Daily check-in streak and points (no token reward). Optional AI advisor, node and storage show *Not configured* until you set them up.

Evidence

- LiteSVM mainnet fork sim, two runs (rounds 437646 and 437756), against the live ORE v3 program (sha256 `b16a10029a35e709956cfe42c4dc51cf2c59522f477eba10816a40bcaa7dd5bd`, unchanged between runs). The app's exact Deploy bytes executed: +400,000 lamports on each of 25 squares for 0.01 SOL. A stale round was rejected.
- Account layout and instruction verified against regolith-labs/ore @ `48c203bd` (Deploy = ix 6, 8-byte amount + 4-byte mask, 12 accounts).
- Devnet: receipt-settlement program, checkpoint and verified receipt in `evidence/devnet-session/`. These were sent from a laptop CLI.
- **UNVERIFIED:** mainnet MWA signing on a real device, until the owner records it.

Tests (each suite separate, never summed)

Suite	Result
Android unit tests	386 run · 379 passed · 7 skipped
Receipt checker	17 passed
LiteSVM receipt-settlement	27 passed
ORE fork sim	2 passed

Rules

One approval per transaction · no background spending · no reward, income or earnings claims (deployed SOL may be lost) · not production-ready.

Next

Claim and checkpoint through the same reviewed path. More real-device testing.

Research (no timelines, no partnerships)

ORE SDK · Reserve viewer · DePIN workloads on owned hardware · TEE/ZK receipt attestation.

Q&A

- **Does it earn anything?** EdgeORE makes no income claims. ORE outcomes are decided by the ORE protocol, and SOL may be lost.
- **Can it spend without me?** No. Each deploy needs your review, your wallet signature and a separate Submit tap. There is no background spending.
- **Is it production-ready?** No.
- **What does the checker prove?** It verifies the integrity of signed receipt contents. It does not prove an on-chain outcome.

HACKATHON.md: EdgeORE (CLOCK IN, Solana Mobile)

EdgeORE is an Android ORE client for Solana Seeker. Every ORE deploy is reviewed, capped, signed in your own wallet, and receipted.

Category: Mobile. No other tracks are claimed.

Built: a live ORE v3 mainnet board and grid. An opt-in Mainnet switch with a risk tick. A 0.01 SOL per-deploy cap. Exact-message review, MWA signing (the app never holds keys), and a single submit with no auto-retry. Android Keystore signed receipts. A receipt checker that verifies the integrity of signed receipt contents. A daily check-in streak and points (no token reward). The optional AI advisor, node and storage need your own setup and show *Not configured* without it.

Evidence: a LiteSVM fork sim against the live mainnet ORE program (two runs, rounds 437646 and 437756, program sha256 `b16a1002…a7dd5bd`). Devnet evidence is in `evidence/devnet-session/`. Device mainnet signing is UNVERIFIED until the owner records it.

Tests (separate, never summed): Android 386 run / 379 passed / 7 skipped · receipt checker 17 · LiteSVM 27 · ORE fork sim 2.

Rules: one approval per transaction, no background spending, no reward or income claims, not production-ready.

Next: claim/checkpoint and more device testing. **Research** (no timelines, no partnerships): ORE SDK, Reserve viewer, DePIN workloads, TEE/ZK.
